BENCHMARK ATLAS / 12 NOVEMBER 2026

Fable 5.2, Opus 5.5 and GPT-6 Astra, benchmark by benchmark

I took the benchmarks from my two survey lists and collected every published result for Claude Fable 5.2, Claude Opus 5.5 and GPT-6 Astra. Where at least two of them have a number, Fable 5.2 has the top score on 28 of 33, Opus 5.5 on 3 and Astra on 2. The effort data is much thinner than the head-to-head, because most labs publish only the maximum setting.

HOW TO READ THE NUMBERS

Most values are maximum-effort scores from the lab that ran the evaluation. A score moves with the harness, with partial against strict credit and with the index version, so where I found two values I show both. A dash means I found no published result, not that none exists.

Section one

Who leads, and by how much

Across the 33 benchmarks where at least two of the three models have a published number, Fable 5.2 holds the top score on 28. The margin is large on long-horizon and agentic work: on Remote Labor Index it scores 41.3 against 21.3 for Opus 5.5 and 20.8 for Astra, and on RoboDojo it scores 64.9 against 39.4 and 29.8. It is small on saturated math, where FrontierMath Tier 4 reads 100, 95 and 97.6. Opus 5.5 leads on PhysicianBench (68.4) and ProgramBench (91.2). Astra leads on ARC-AGI-2 (95 against 93.3).

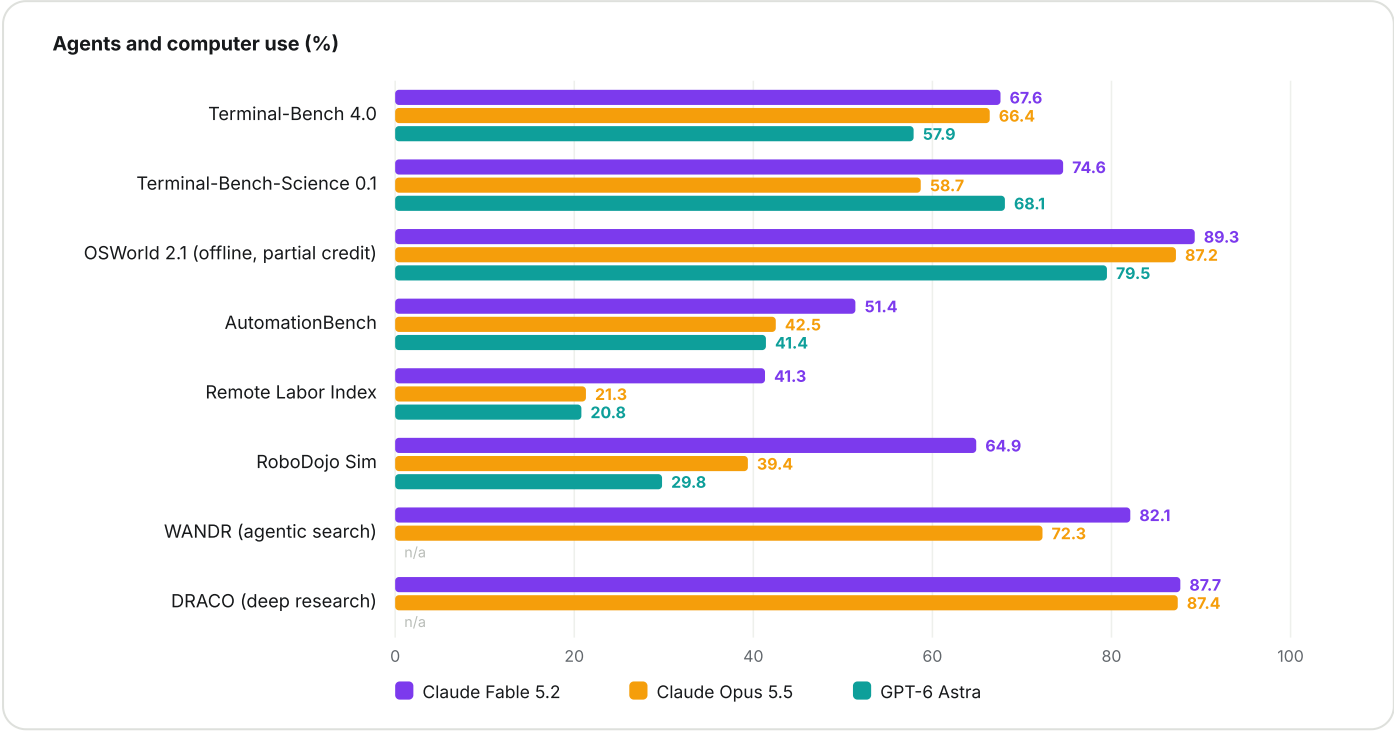

Figure 1. Agents and computer use. OSWorld 2.1 is the offline, partial-credit variant; the strict score is lower (see the conflicts table).

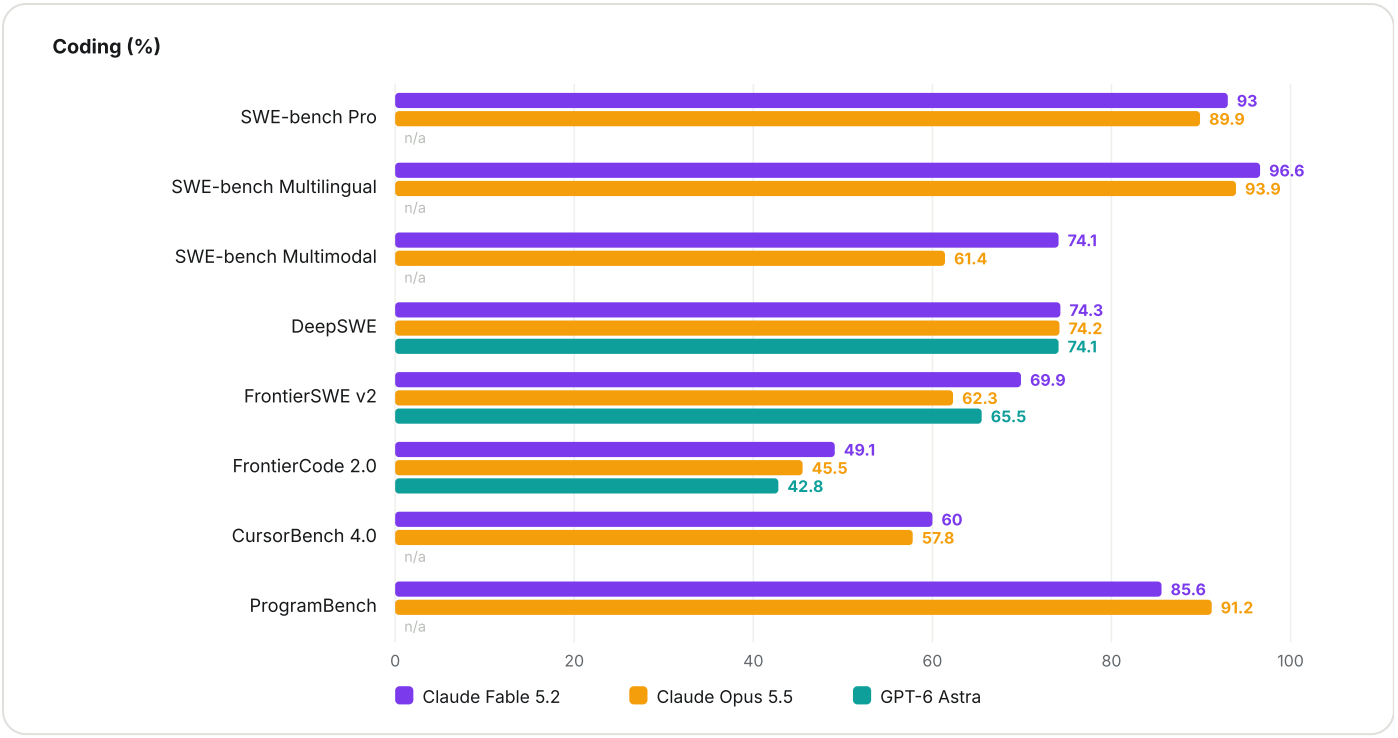

Figure 2. Coding. FrontierCode 2.0 shows each model's best published run; harnesses differ by lab.

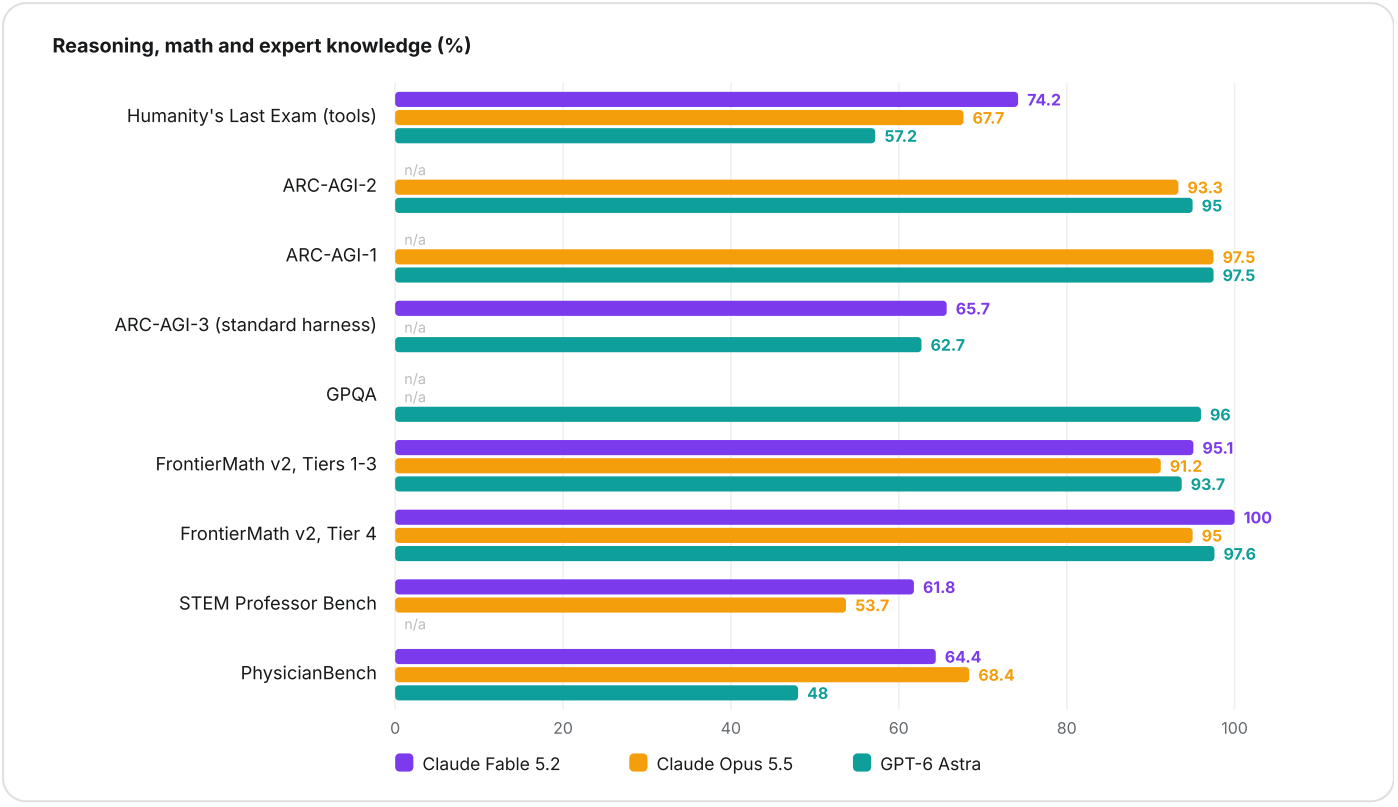

Figure 3. Reasoning, math and expert knowledge. ARC-AGI-3 is the standard harness; the provider-adapter harness reads far higher for both models.

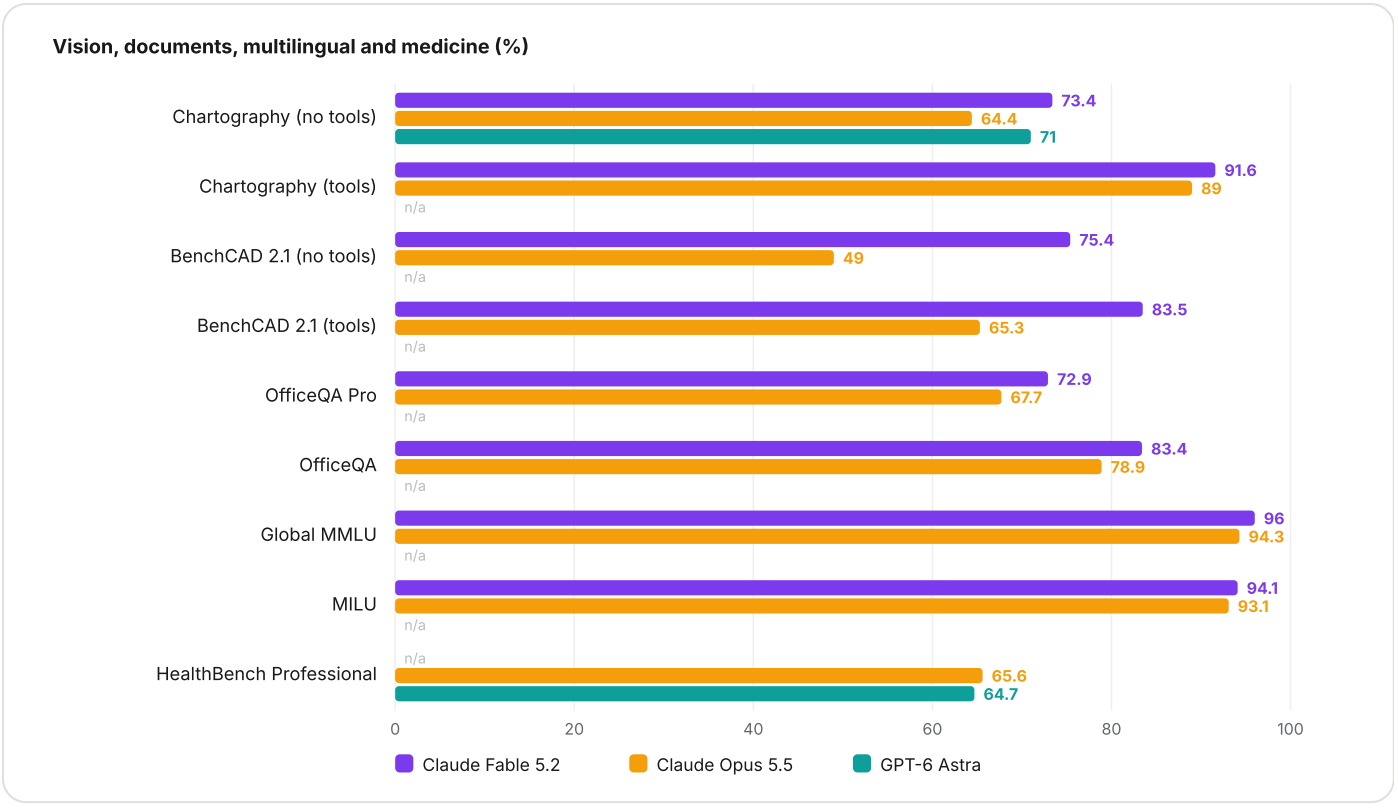

Figure 4. Vision, documents, multilingual and medicine.

Section two

What the effort setting buys

Fable 5.2 is the only one of the three with a published curve across all five settings, on the Artificial Analysis Intelligence Index. It climbs from 54 at low to 65 at max, but not evenly: low to high adds 8 points for about 11 more minutes per task, while high to max adds 3 points for about 28 more. High and xhigh tie at 62, so on this index xhigh buys time and not points. Opus 5.5 spans 35 at low to 58 at max; Artificial Analysis lists its medium, high and xhigh settings on the cost-quality frontier but does not give numbers for them. Astra is published at max only, at 57.

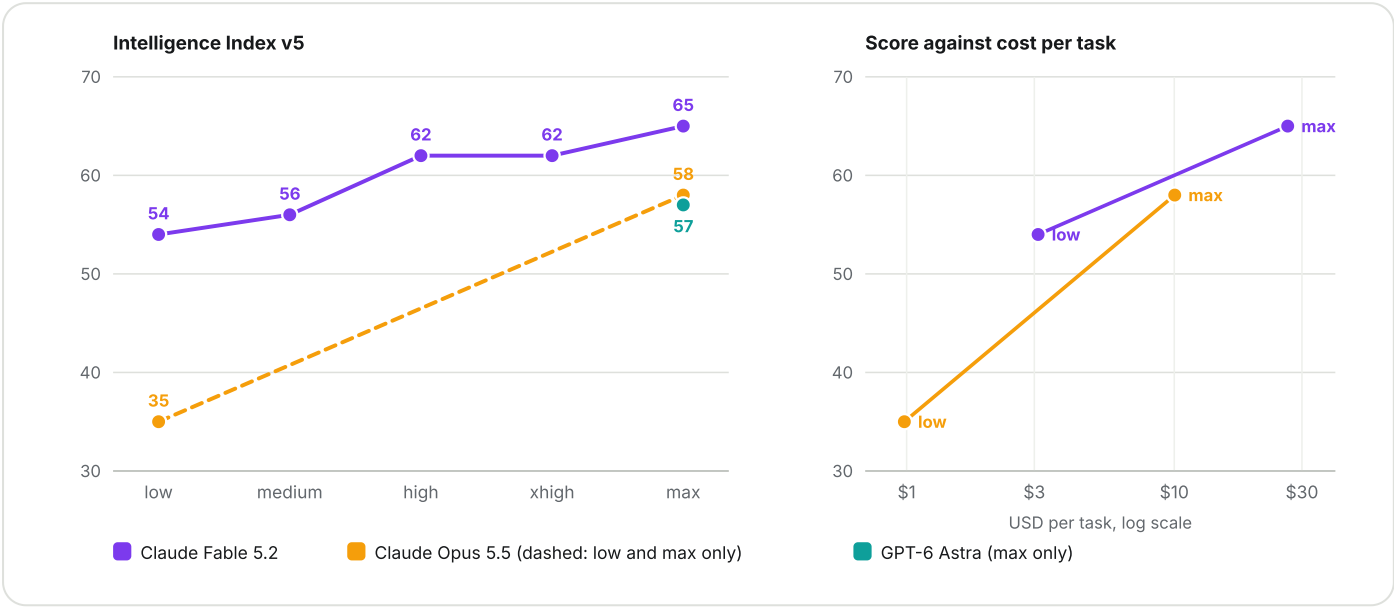

Figure 5. Artificial Analysis Intelligence Index v5 by effort setting (left) and score against cost per task (right). Opus 5.5 reads 58 in Artificial Analysis's launch article and 59 on its v5 leaderboard page; I plot 58.

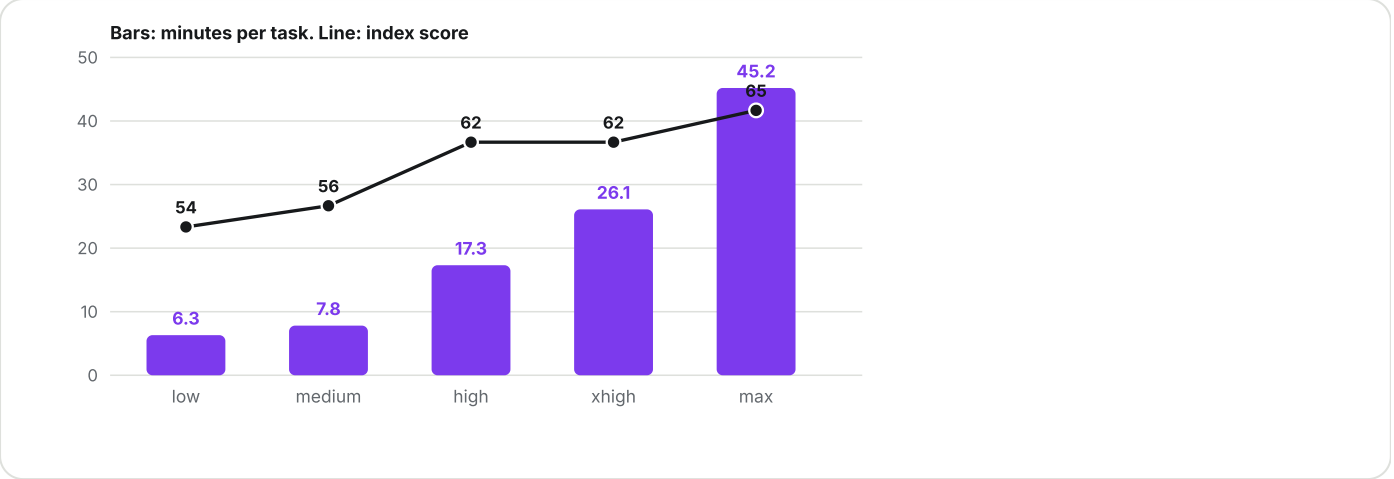

Figure 6. Fable 5.2 on the same index. Cost per task runs from about $3.10 at low to about $26.50 at max.

ARC-AGI-3

Astra has a full ladder here, and the harness matters more than the effort setting. Under the standard harness it improves steadily, from 17.5% at low to 62.7% at max, with the no-reasoning run at 35.2%. Under the provider-adapter harness every setting lands between 96.7% and 99.9%. In both, higher effort is cheaper per run, because fewer steps are wasted. For Fable 5.2 one source lists 65.7% (standard) and 94.9% (adapter), and another lists different stored rows, so I treat its ARC-AGI-3 figure as unsettled.

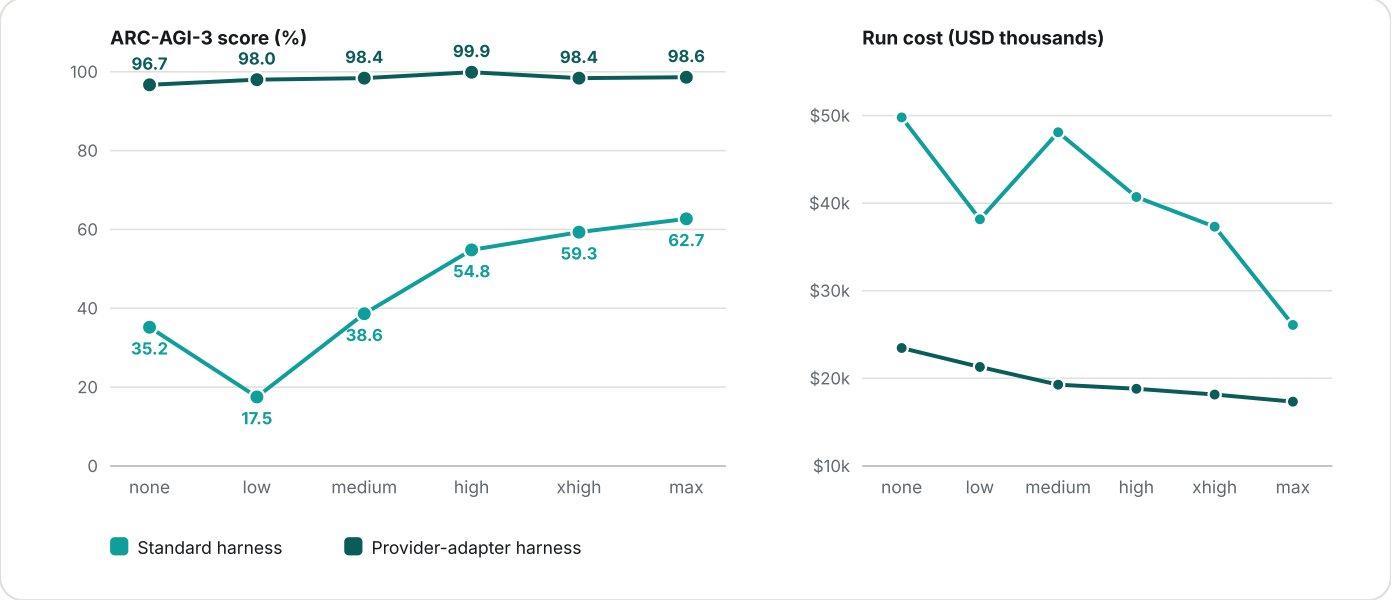

Figure 7. GPT-6 Astra on ARC-AGI-3 (semi-private set), score by effort for two harnesses (left) and the total cost of each run (right).

Coding, expert exams and data analysis

These ladders are short, and the harnesses differ: Opus 5.5 ran in Claude Code, Astra in Codex, and Fable 5.2's FrontierCode points come from Anthropic's own run. On FrontierCode 2.0, Opus 5.5 reaches 43.4 at xhigh and 45.5 at max; Astra 38.3, 41.4 and 42.8 from high to max; Fable 5.2 45.3 at high and 49.1 at xhigh, at $6.72 and $14.19 per task. On CursorBench 4.0, Opus 5.5 goes from 52.5 (medium) to 57.8 (max), flat at 56.0 across high and xhigh. On Humanity's Last Exam under Artificial Analysis's harness, Opus 5.5 jumps from 57.5 at xhigh to 61.4 at max while Fable 5.1 barely moves, 58.7 to 59.1.

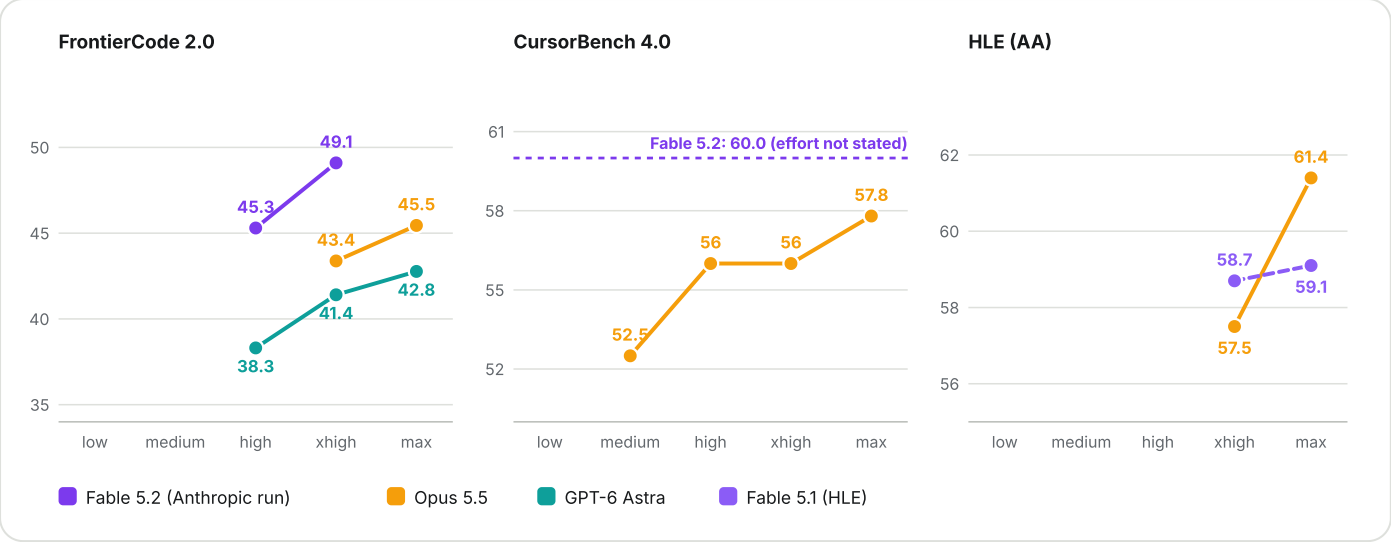

Figure 8. Effort ladders on FrontierCode 2.0, CursorBench 4.0 and Humanity's Last Exam.

Two more data points argue against assuming that more effort always helps. Astra on Hex DataBench v1.1 scores 55.0 at low and 55.0 at max, with a dip to 52.0 at high. On a 44-problem math study it scored 98.9% at medium and 97.7% at high, with overlapping 95% intervals. An arithmetic prompt was solved at every setting while output tokens grew from 546 to 1,422. Fable 5.2 on Chartography (no tools) gains from 66.4 at medium to 73.4 at max, against 64.4 for Opus 5.5 and 71.0 for Astra.

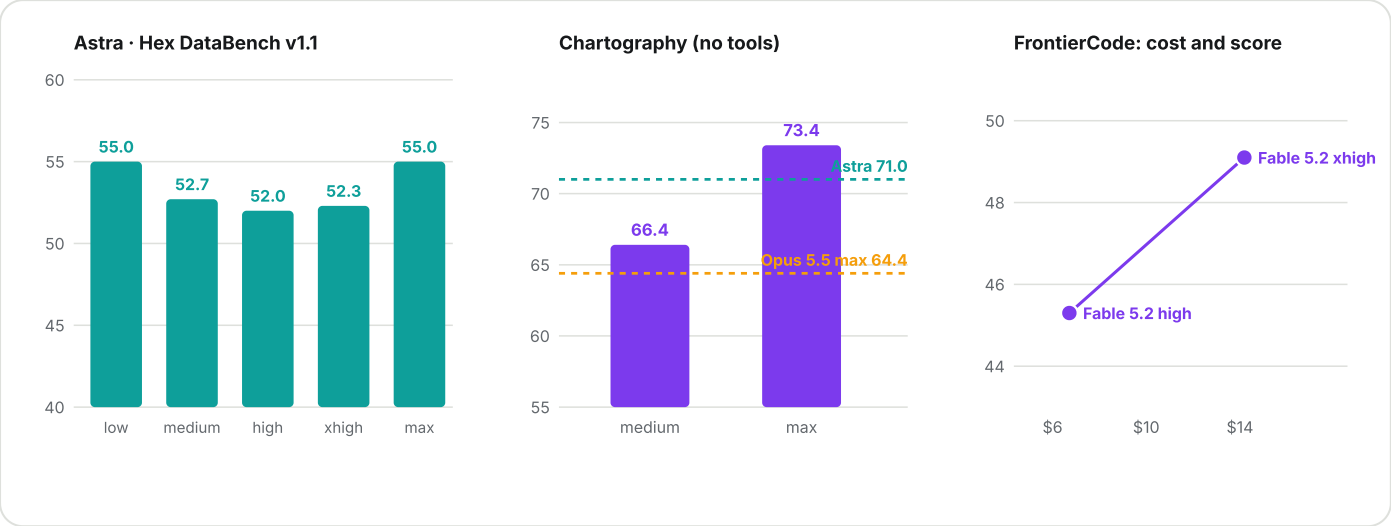

Figure 9. Astra on Hex DataBench v1.1 by effort (left), Chartography without tools (center), and Fable 5.2's FrontierCode cost against score (right).

Section three

Where sources disagree

The same benchmark often has two published numbers because of harness, partial against strict credit, index version, or an aggregator storing a different run. I keep both rather than choose. Several aggregator pages also cite documents that belong to other models, so I treat aggregator figures as claims until a primary page agrees. Opus 5.5's cyber figures were measured without safeguards; Fable 5.2 ships with them and falls back to a default model for certain requests, which affects tool-free comparisons.

BENCHMARK	VALUE A	VALUE B
ARC-AGI-3, Fable 5.2	65.7 (standard) / 94.9 (adapter)	79.26 / 97.72 (stored rows on one aggregator)
OSWorld 2.1, Fable 5.2	89.3 (offline, partial credit)	54.6 (strict)

Section five

The catalog

270 benchmarks from the mainstream sweep and from the esoteric pass. 61 have a score on a page I could read; 209 are listed without one. The model shown is the latest or top-ranked model I found a number for, which is not necessarily the newest model in existence: a leaderboard shows its leader, and many pages were undated or unreachable. Benchmarks with no result are collected under each heading, and that means I found none, not that none exists.

Sources

Primary data. Anthropic announcement pages and the Claude Opus 5.5 system card; OpenAI's GPT-6 Astra materials; Artificial Analysis (Intelligence Index v5 and its effort breakdowns); ARC Prize results; Epoch AI (ECI, FrontierMath); Vals AI; Hex's DataBench write-up; BenchLM comparison pages and benchmarklist.com leaderboards for per-benchmark scores.

What I verified. Every figure was read from a page I could open, and nothing is estimated or interpolated. Where two sources disagree both values appear.

What I could not verify. Per-effort data exists for very few model and benchmark pairs, so most effort ladders here have two to four points. Several aggregator figures have no primary page behind them. Many official leaderboards render client-side and

returned nothing, so those benchmarks show no result in the catalog.
